This will be a 1 man team, I intend to work on the project at least once a week for a few hours, or more if required. There will be no meetings as there is no one to meet with. I will take all roles and responsibility for the completion of the project.

It was said that if I couldn't find an advisor, one would be assigned. I'm not sure if that has been down yet, so I suppose there's not much I can do about that.

The project will be to create a framework that has different payloads on it that can go into different devices and provide an effect. My plan is to take 3 different devices and make exploits for all of them, for example;

- an exploit that will make a printer send a copy of every file sent to it to back to the exploiter
- an exploit that will turn on a laptop webcam without the light, and send images to the exploiter
- anything else in that same vein of thinking.
